                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              'Protein name confidence' is used to rate our confidence of the accuracy of the protein name.

Class 1: Function experimentally demonstrated in P. aeruginosa.

Class 2: Function of highly similar gene experimentally demonstrated in another organism (and gene context consistent in terms of pathways its involved in, if known).

Class 3: Function proposed based on presence of conserved amino acid motif, structural feature or limited sequence similarity to an experimentally studied gene.

Class 4: Homologs of previously reported genes of unknown function, or no similarity to any previously reported sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 complement (128. .826)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This represents the February 3, 2003 version of the continually updated, reviewed, Pseudomonas aeruginosa PAOI genome annotation, from PseudoCAP (see http://www.pseudomonas.com for latest updates and links to alternate annotations). PseudoCAP is coordinated by Fions S.L. Brinkman (Simon Fraser University, Canada) and Robert E.W. Hancock (University of British Columbia, Canada). We welcome submission through www.pseudomonas.com of any proposed changes.
                                                                                                                    Bacteria; Proteobacteria; Gammaproteobacteria; Pseudomonadales;
Pseudomonadaceae; Pseudomonas.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicated order and orientation of each sequence contig has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by Pork testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Submitted (04-MAY-2002) NIH Intramural Sequencing Center, 8717 Grovemont Circle, Gaithersburg, MD 20877, USA (bases 1 to 208443)

	AL RS AL	er: Washington University Genome Sequencing Center er code: WUGSC seite: http://genome.wustl.edu/gsc act: sapiens@watson.wustl.edu Summary Statistics er project name: H_NH0438012	NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.	This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.	MAPPING INFORMATION: Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc	SOURCE INFORMATION: The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome in the parties.	Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at the Roswell Park Cancer Institute (http://bacpac.med.buffalo.edu) VECTOR: pBACe3.6 NEICHBORING SEQUENCE INFORMATION: The clone sequenced to the left is RPII-347L11. Actual start of this clone is at base position 1 of RPII-438012; actual end is at base position 217346 of RPII-438012.	Data from AC079879 was used to finish this clone, AC012363. Polymorphisms exist between AC012363 and AC079879. There is a single plasmid region from 188387 to 188395. ```
Sequence Assistance in a sequence between the experimentally derived digest fingerprinting. Comparison of the experimentally derived digest fingerprinting. Comparison of the experimentally derived digest fragments with sequence-predicted fragments is given below. The electronically-dispested sequence consists of both insert and vector, in order to accurately represent the entire circular BAC. Small fragments below a variable cutoff (approximately 400-800 bp) are not resolved in the fingerprint and hence do not appear in the table. There are no significant remaining discrepancies between the experimental and predicted values. Uniquely ordered fragments are separated by dashed lines.

                                                                                                                                                                                                                                                                                                                                                                                 Sequence Quality Assessment:

Sequence Quality Assessment:

This entry has been annotated with sequence quality estimates computed by the Phrap assembly program.

All manually edited bases have been reduced to quality zero. Quality levels above 40 are expected to have less than 1 error in 10,000 bp.

Base-by-base quality values are not generally visible from the GenBank flat file format but are available as part of this entry's ASN.1 file.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 6222
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       < 800

NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

* NOTE: This is a 'working draft' sequence.

* This sequence will be replaced

The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

* NOTE: This is a 'working draft' sequence.

* This sequence will be replaced

Submitted (15-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Nov 15, 2002 this sequence version replaced gi:23908040.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence cands. Both end sequences and whole genome shotgun sequence contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bom.tmc.edu/docs/Genbank_draft_data.html)
NOTE: This sequence may represent more than one clone.
NOTE: This is a "working draft' sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
Steimle, M., Strong, R., Sutton, A., Svatek, A., Tabor, P., Taylor, C., Taylor, T., Thomas, N., Thomas, S., Tingey, A., Trejos, Z., Usmani, K., Valas, R., V., Villasana, D., Waldron, L., Walker, B., Wang, J., Wang, Q., Wargen, S., Warren, R., Wairen, R., Waire, F., Wailtams, G., Willson, R., Werzey, K., Wooden, H., Worley, K., Wright, D., Wright, R., Wu, Yan, Yan, J., Yoon, L., Yoon, V., Yu, F., Zhang, J., Zhou, Y., Zhou, X., Zhou, S., Dunn, D., von Niederhausern, A., Weiss, R., Smith, D.R., Holt, R.A., Smith, H.O., Direct Submission

On Oct 12, 2002 this sequence version replaced gi:21903188. The sequence in this assembly is a combination of BAC based reads and whole genome shoctum sequencing reads assembled using Atlas in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold', Within each contig-scaffold', Within each contig-scaffold, in the sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shoctum sequence reads. Both end sequences and whole genome table. Worley,K.C.

3 (bases 1 to 308821)
Rat Genome Sequencing Consortium. * NOTE: Estimated insert size may differ from sequence length

* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html)

* NOTE: This sequence may represent more than one clone.

* NOTE: This sequence may represent more than one clone.

* NOTE: This is a "working draft" sequence. It currently

* consists of 35 contigs. The true order of the pieces

* so not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved. wright,D., Wright,R., Wu,J., Yakub,S., Yen,J., Yoon,L., Yoon,V.,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        80
                                                                                                                                                                                                                                                              The present invention describes a Babesia canis associated protein (I), comprising a Bevirls protein of 15 kD molecular weight (MW) and having a sequence of at least 80% homology to a sequence (ABPS714) of 141 amino acids, or a Bevirl3 protein of 32 kD MW and having a sequence of at least 80% homology to a sequence (ABPS7115) of 285 amino acids, or their immunogenic fragments. (I) have antiparasitic and immunostimulant activities, and can be used in vaccines. (I) can also be used for the preparation of a vaccine for combating B. canis infections. (I) is also useful in a diagnostic test for the detection of antibodies against B. canis associated antiganic material. The present sequence encodes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a Babesia canis associated protein (I), comprising a Bevirls protein of 15 kD molecular weight (MW) and having a sequence of at least 80% homology to a sequence (ABPS3714) of 141 amino acids, or a Bevirl32 protein of 32 kD WW and having a sequence of their immunogenic fragments. (I) have antiparasitic and immunostimulant activities, and can be used in vaccines. (I) can also be used for the preparation of a vaccine for combating B. canis infections. (I) is also useful in a diagnostic test for the detection of antibodies against B. canis associated antigenic material. The present sequence encodes Bevir32 from the present invention.

```
The invention relates to an isolated polymucleotide (I) comprising a nucleotide sequence selected from any of 948 sequences (ABZ1119-ABZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polymucleotides are useful coding protein or complementary sequences. The polymucleotides are useful cor identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABPG8902-ABP68849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cell-proliferative disorders (cancer), neurodegenerative diseases (Parkinson's or Alzahamer's disease), autoimmume diseases (multiple cell-proliferative disorders (assase), autoimmume diseases (multiple disorders, platelet or coagulation disorders, wound, burns, incision, parasitic), arthritis, etc.

Solection of the printed continue and content of the printed spatesticication, but was obtained in electronic format directly from WIPO

ю . Novel human disease detection and treatment polypeptide, useful in diagnosis, prevention or treatment of cell proliferative disorders earteriosclerosis, cirrhosis and an autoimmune/inflammatory disorder e.g. AIDS

Claim 1; Page 375-376; 618pp; English.

The invention relates to an isolated human disease detection and treatment (MDDT) polypeptide (I) selected from a polypeptide having a sequence selected from 254 sequences (ABP51231-ABP51484) given in the sequence selected from 254 sequences (ABP51231-ABP51484) given in the specification, a naturally occurring polypeptide comprising a sequence (I) and set of (I) or a biologically active or manuogenic fragment of (I). (I) is useful for screening a compound for effectiveness as an agonist or antagonist, for screening a compound that specifically binds (I) or amodulates the activity of (I), and for preparing a polyclonal or moncolonal antibody by hybridoma technology.

Nucleic acids (II) (ABQ72449-ABQ72700) encoding (I) are useful for screening a compound for effectiveness in altering expression of a target polyunclectide comprising. Oligomoclectides and antibodies are useful for detecting MDDT in a sample or for assessing toxicity of a test compound, in a sample or for assessing toxicity of (I) in a sample, and for purifying (I) from a sample, for detecting (I) in a sample, and for purifying (I) from a sample. A composition comprising (I), an associated with decreased or increased expression of functional MDDT.

(I) or (II) are useful for diagnosing, treating or preventing disorders

2692 ATCACCTCCAGCCTCAGGTCCTGCGTGCTTCCCGCCGGGTCCGGCCCCCACCCCAGAG 2633 associated with aberrant expression of MDDT, where the disorders are selected from a cell proliferative disorder such as arteriosclerosis, cirrhosis, hepatitis, psoriasis, and cancer and an autorimune/inflammatory disorder such as AIDS, Addison's disease, allergy, anaemia, asthma, atherosclerosis, gout, multiple sclerosis or hebumatoid arthritis. (Il) are useful for creating knockin humanised animals or transgenic animals to model human diseases, in somatic or germline gene therapy, to generate a transcript image of a tissue or cell type, for detecting differences in the chromosomal location due to translocation or inversion among normal, carrier or affected individuals and as hybridisation probes for mapping naturally occurring genomic 2788 ------aderreagercadeccadeccadecerecedes 2632 GIGGCTGTICCGCIGCCTGCCCCGACTGICCACCCGCAGGIACAGGGCTCCTGIAGIC 2573 111 gleuProGluGlyHis-----ProLeuLeuGluLysArgAlaGluTyrPheArgHisLe 129 3 SerThrSerThrThrThrAsnPheValAlaGluAsnArgProThrPheGlyGluThrPhe 22 23 AspValMetArgGluAlaLeuLeuArgValLysSerSerGluArgLeuAlaMetLeuArg 42 61 IleAlaAlaThrValThrProLysGlyAlaSerMetLysLeuLysProProArgProGln 80 43 AlaLeuAlaGlyMetCysGlyHisArgValLeu-----ProGlyThrGlyAlaSerAla 2752 GIGATATCCACGGTCACAGGCACTGTGGCACTCCGGGAACCAGGCAGAGGCCCCCGTGCT -------GluMetAsnLysThrIleSerGlnGluSerAlaArgVal-AsnHisAr 2572 TGGTTAATACCAAAATAGGGGGAAGAGGTGGCAAGGGAA---TACAGAACCAGGCCATCG 2515 GCACCCCCATCCTCATCTGTGGCCTGCACGTGACCCAAGCTGTGGCCACGCCGGGCACCT 81 ---SerThrLysSerProGluLeuArgGluLeuSerArgLysIleArg----Sequence 4839 BP; 946 A; 1467 C; 1418 G; 1008 T; 0 other; Length:

Tang YT; Burford N; Xu Y; Lu Y;

This invention relates to twelve human receptors CDNA sequences
referred to as REPTR-1 to REPTR-12), and the proteins encoded thereby.
The proteins of the invention may have antihifalmmancry, cytostatic,
immunosuppressive, antiviral, anti-HIV, antiarthritic, muscular active
general, anticonvulsant, nootropic, neuroprotective, antiallergic
activities. The sequences of the invention may be used to produce REPTR
activities. The sequences of the invention may be used to raise
anti-REPTR antibodies. These molecules and the REPTR polynucleotides and
prevention of gastrointestinal (e.g. gastritis, oesophageal carcinoma,
Crohn's disease, irritable bowel syndrome, ulcerative colitis,
endocrine (e.g. hypothalamus disorder, Kallana's disease), autoimmune/
inflammatory (e.g. acquired immune deficiency syndrome (AIDS),
rheumatoid arthritis, allergies, osteoarthritis, diabetes mellitus,
multiple sclerosis, systemic lupus erythematosus), cell proliferative
dystrophy), neurological (e.g. pulchenne and Becker muscular
dystrophy), neurological (e.g. pulchenne and specker muscular
dystrophy), neurological (e.g. pulchenne and specker muscular
dystrophy), neurological (e.g. epilepsy, Alabeimer's disease,
Huntington's disease) and reproductive (e.g. infertility, endometriosis)
sequence of the invention. Sequence 10123 BP; 1935 A; 3207 C; 2984 G; 1997 T; 0 other;

The invention relates to a novel method for identifying a candidate p53 pathway modulating agent. The method comprises providing an assay system comprising a purified cadherin (CAD) polypeptide or nucleic acid, or their functionally active fragment or derivative. The method is useful for identifying a candidate p53 pathway modulating agent, modulating a p53 pathway of a cell and for diagnosing a disease in a patient. In particular, the disease is cancer, e.g. breast cancer, colon cancer, kidney cancer, lung cancer or cancer of the ovary, which has an expression level of greater than 25%. The identified modulators are useful as targets for novel therapeutics. This polymoleotide sequence represents a cadherin (CAD) nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   42

Example 2; Page 12; 41pp; English.

The present invention describes a Babesia canis associated protein (I), comprising a Bevirl5 protein of 15 kD molecular weight (MW) and having a sequence of at least 80% homology to a sequence (ABP53714) of 141 amino acids, or a Bevir32 protein of 32 kD WW and having a sequence of at least 80% homology to a sequence (ABP53715) of 285 amino acids, or their immunogenic fragments. (I) have antiparasitic and immunostimulant activities, and can be used in vaccines. (I) can also be used for the preparation of a vaccine for combating B. canis infections. (I) is also useful in a diagnostic test for the detection of antibodies against B. Canis associated antigenic material. The present sequence represents a PCR primer for Babesia canis Bovir which is used in an example from

Claim 2; Figure 10A; 256pp; English.

The invention relates to isolated protective sequence polypeptides (I) and polynucleotides (II). (II) is useful for transferring a protective and polynucleotides (II). (II) is useful for transferring a protective conditions of sequence into a cell, which delays and/or prevents the cell from undergoing cell death. Protective sequences, their products or at stages for treatment and diagnostic of conditions, disorders or diseases involving cell death. The protective sequences and their conditions, disorders or products are useful for preventing or treating disorders of the central nervous system including neurological and psychiatric conditions, cerebral oedema, infections such as menhalitie, degenerative diseases such as multiple sclerosis, nutritional conditions, disorders of the cause cell death in organ systems including blood vessels, heart (ischaemia), blood cells (autoimmune hamenlytic anaemia), respiratory system (asthma), call cavity gastrointestinal tract, liver (cirrhosis), pancreatitis, polycystic renal disease, urinary tract, liver (cirrhosis), pancreatitis, polycystic renal disease, urinary tract, genitalia (congenital anomalies), endometriosis, breast (chronic mastitis), thyroid (steeporosis)). The compositions promote cell death and are useful for treating and/or amaliorating cancer and autoimmune diseases. The composition which induce cell death, and are useful to raise an immune response, as a reagent in assays designed to raise an immune response, as a reagent in assays designed to raise an immune levels of the protein in biological fluids, as markers for tissues in which the corresponding protein is expressed and to isolate receptors or ligands as described in the invention.

It can be used in the development of an anti-cancer agent and an anti-HIV agent. It can also combine with actin in the control of

Compositions and methods for the detection of hematological malignancies, e.g. chronic lymphocytic leukemia, lymphoma, follicular lymphoma and Hodgkin's and T/B cell non-Hodgkin's lymphoma Claim 31; Pages 504-505; 1252pp; English

The present invention relates to compositions and methods for the detection, diagnosis and therapy of haematological malignancies. The present sequence is the coding sequence of a human haematological malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen (s) in a sample obtained from the parient (an increased level of the polypeptide, compared to an unaffected individual, is indicative of an the present invention are chronic lymphocytic leukaemia, lymphoma, follicular lymphoma, Hodgkin's lymphoma, non-Hodgkin's lymphoma and T/B cell non-Hodgkin's lymphoma.

Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity

Claim 1; SEQ ID No 237; 114pp; English.

The invention relates to detecting (MI) granulocyte (GC) activation (CCA), by detecting the level of expression of gene (s) (GS) identified by DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated (CC GC, where differential expression of GS is indicative of GGA.

The alters the expression of at least one gene in GS: (2) screening (M3) for an alters the expression of at least one gene in GS: (2) screening (M3) for an agent capable of modulating GCA or an inflammation (especially chronic) in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the CC chronic) in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the control of expression in a sample of the gene is indicative of inflammation, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammation (especially chronic) or in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammation with an agent that modulates the expression of gene (s) from GS, where the level of expression in a subject, exposure of a subject to a pathogen or sterile inflammation with an agent that modulates the expression of gene (s) inflammation with an agent that modulates the expression of gene (s) inflammatory disease, and is useful for screening an inflammation in a tissue, while useful for detecting of the gene in a subject, exposure of a subject to a pathogen or response in a subject, exposure of a subject to a pathogen or respective only an inflammation in a tissue, while is the control of the general of the general infection, proceed a subject to a pathogen or respective of a subject to a pathogen or respectively of inflammatory bowel disease, also bacterial infection, viral infection and MS is parasited an expense of the parasited and pare the parasited and pare the parasited of the pa

The invention relates to isolated protective sequence polypeptides (I) and polymucleotides (II). (II) is useful for transferring a protective and polymucleotides (II). (II) is useful for transferring a protective sequence into a cell, which delays and/or prevents the cell from undergoing cell death. Protective sequences, their products or antibodies are useful diagnostically, prophylactically, therapeutically cor as targets for treatment and diagnosts of conditions, disorders or diseases involving cell death. The protective sequences and their products are useful for preventing or treating disorders of the central cerebral oedema, inflections such as meningitis, degenerative diseases such as Alzheimer's and motor neuron disease, demyelinating diseases such as multiple sclerosis, nutritional conditions, disorders of the cause cell death in organ systems including blood vessels, heart (ischaemia), blood cells (autoimmune haemolytic anaemia), respiratory system (asthma), oral cavity, gastrointestinal tract, liver (cirrhosis), cancential, anomalies), endometriosis, preast (chronic mastitis), thyroid consential anomalies), endometriosis, preast (chronic mastitis), thyroid (steephorosis) if the compositions promete cell death and are useful for treating and/or ameliorating cancer and autoimmune diseases. The compositions promete cell death and are useful to raise an immune response, as a reagent in assays designed to crasing byte area in the corposition of the protein in biological lings cure and are useful to raise an immune response, as a reagent in assays designed to the carises an eceptors or ligands as described in the invention.

"Xx and consider the corpositions or ligands as described in the invention.
S.

This sequence encodes a glutathione S transferase/human p57 fusion protein. This sequence is derived from the plasmid pGEX/hp57. This plasmid is used in the expression of the human p57 protein. p57 contains a leucine rich C-terminal peptide which comprises a leucine residue after each 7 amino acids and a WD40 repeated structure region containing flux WD40 regions. p57 forms a dimer. It can be used in the development of an anti-cancer agent and an anti-HIV agent. It can also combine with actin in the control of cell movement.

                                        human p57
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence encodes a glutathione S transferase/truncated human pifusion protein. This sequence is derived from a derivative of the plasmid pGSX/Mp57. This plasmid is used in the expression of the human p57 protein. p57 contains a leucine rich C-terminal peptide which comprises a leucine residue after each 7 amino acids and a WD40 repeated structure region containing five WD40 regions. p57 forms a diamer. It can be used in the development of an anti-cancer agent and an anti-HIV agent. It can also combine with actin in the control of cell movement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A new protein, p57, comprising WD40 repeat region - used for development of anti-cancer and anti-HIV agents
                                                                                                                                                                                                                                                                          WD40 repeated structure region; bovine p57 protein, dimer; anti-cancer; anti-HIV agent; actin; cell movement; ds.
                                                                                                                                                                                                                                                  GST/truncated human p57 fusion protein coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1842 BP; 422 A; 462 C; 532 G; 426 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1842

and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects. The method therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the despress of cytosine methylation described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   107

Determining the degree of cytosine methylation in genomic DNA, for diagnosis and prognosis, comprises selective hybridization amplicons from chemically treated DNA. ä Guetig Berlin K, Piepenbrock C, 2002-371829/40 Olek A, 

56pp + Sequence Listing; 56pp; German. Claim 12; This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a general search and the capture of the general convert of the general search and the convert of the degree of thylated C is amplified to form a labeled amplicon. The amplicon is thybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligoners and the degree of hybridisation to both classes is determined from the label on the amplicon. The degree of methylation is calculated. The method classes of oligoners, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of the range of diseases, e.g. cancer of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiations or single nucleotide polymorphisms status of many C residues to be determinated simulaneously. ABG13410-ABG54121 represent genomic DNA sequences used to illustrate the body of the chermining the degree of Cytosine methylation described in the disclosure of the invention.

Novel polynuclectide comprising Bifidobacterium genome sequence useful as a probe or primer for detecting and/or identifying Bifidobacterium longum in a biological sample

Claim 1; SEQ ID 1; 80pp; English.

The present invention describes a polynuclectide (I) comprising a sequence of a Bifidobacterium genome selected from the nuclectide sequence given in ABO81842 and ABO81843, or a sequence exhibiting at least 90% identity or which hybridises with the sequence exhibiting at least 90% identity or which hybridises with the sequence exhibiting at least 90% identity or which hybridises with the sequence given in ABO81843. Also described is a polynuclectide (II) encoding a fusion protein, comprising a sequence selected from 1097 sequences given in ABD6258 to ABD66354 ligated in frame to a polynuclectide encoding a heterologous polypeptide. (I) has antidiarrheic and nutibacterial activities, and can be used as an inhibitor of Salmonella. (I) (Which is a probe) is useful for the detection and/or identification of Bifidobacterium longum in a biological sample. A carrier containing the lactic acid bacteria and/or treating diarrhoea brought about by pathogenic bacteria and/or rotavirus. The carrier is a food composition pathogenic bacteria and/or rotavirus. The carrier is a food composition selected from milk, yogurt, curd, cheese, fermented milks, milk based fermented products, infant formula, pet food or a pharmaceutical composition selected from tablets, liquid bacterial suspensions, dried oral supplement, wet oral supplement, dry tube feeding or wet tube feeding. (I) is useful in DNA arrays or chips to carry out analysis of the sidiobacterium related nucleotide sequences given in the Sequence file and experient in the present invention but not mentioned further within the sequences. cation. %XCCCCCCCCCCCCCCCCCCCCCCCCCX

Novel isolated mucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer -

Claim 1; Page 3457; 11750pp; English.

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:

(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient;
(e) selecting a composition for inhibiting prostate cancer in a patient;
(f) assessing the prostate cell carcinogenic potential of a compound;
(g) determining whether prostate cancer has metastasized in a patient;
(h) assessing the aggressiveness or indolence of prostate cancer in a patient; (I) is also useful as a pharmacodyanamic or pharmacogenomic marker. 889999999999998<del>8</del>8

Chimeric CauTaq DNA polymerase version 1 polynucleotide

CauTaq DNA polymerase; 3'-5' exonuclease; mutant; proof-reading; second strand DNA synthesis; PCR; ss.

The sequence represents a polynucleotide encoding a chimeric CauTaq DNA polymerase polypeptide. The chimeric polypeptide comprises a 3.-5, exonuclease domain from one DNA polymerase and a DNA polymerase domain from a heterologous DNA polymerase. This molecule has a domain exhibiting 3.-5, exonuclease activity derived from Cau DNA polymerase and another exhibiting DNA polymerase activity from Taq DNA polymerase. These chimeric sequences are useful in molecular biology and gene technology techniques, especially second strand DNA synthesis, PCR amplification and polymerase particularly useful in techniques where the fit between the primer and the template DNA is not exact. Chimeric DNA polymerase useful in molecular biology and gene technology techniques, has domain having proof-reading activity from a DNA polymerase domain from heterologous DNA polymerase -...1812 -*tag= a 'product= "Chimeric CauTaq DNA polymerase" partial note= "No stop codon present Claim 13; Page 44-48; 66pp; English. ```
proteins from Neisseria genomic sequences. AAAB1453 to AAAB2414

represent specifically claimed Neisseria meningitidis genomic DNA
sequences; AAAB1260 to AAAB1303 and AAB25650 to AAB2565 represent
Neisseria DNA sequences and their corresponding proteins; AAAB1254 to
AAAB1259 and AAAB1304 to AAAB1321 represent PCR primers used in the
isolation of Neisseria meningitidis DNA sequences; and AAAB1322 to
AAAB1452 represent Neisseria meningitidis MenB polymuclectide ORF
sequences, which are all used in the exemplification of the present
invention. The mucleic acid sequences, protein sequences, and antibodies
against them, can be used in the manufacture of a composition. The
composition can be used as a medicament (or in the manufacture of
medicament) for treating, preventing or diagnosing infection due to
Neisserial bacteria. For example, some of the identified proteins could
be components of vaccines against Meningococus B; against all serotypes,
and/or against all pathogenic Neissariae. Identification of sequences
from the bacterium will also facilitate production of biological probes,
particularly organism specific probes. Attempts to make efficacious
whiling or unsained by the components of the propersor of the particularly organism specific probes. Attempts to make efficacious
whiling or unsained by the components of the propersor of the particularly organism specific probes. Attempts to make efficacious
whiling or unsained by the components of the particularly organism specific probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            159 cócccadaragarda contropado con consequencos de accesa de actual de actua

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          27 GluAlaLeuLeuArgValLysSerSerGluArgLeuAlaMetLeuArgAlaLeuAlaGly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         299 CTGCTGÀCGACGTCGCCGCCGGGCCGGTCGAGCAATTTGGATCTGAACGCCCCGATG

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (FOR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or admitistating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations or esponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences AAS64197-AAS94564 represent novel human and captured data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

WPI; 2001-457726/49

Isolated polypeptide for treating, preventing and prognosing disorders related to the endocrine system including endocrine disorders, reproductive disorders, and gastrointestinal disorders and also for testing and detection e.g. diagnosis

Disclosure; SEQ ID No 577; 558pp; English

The invention relates to cDNAs encoding novel human endocrine antigens or a fragment having biological activity, a domain, an epitope, full length protein, variant, allelle variant or a species homologue of the cDNA/antigen. The DNAs and polypeptides are useful for preventing, treating or ameliorating a medical condition when administered (e.g. by gene therapy or antisense-therapy). Identifying mutations in the genes coding for the antigens is useful for diagnosing a pathological condition or a susceptibility to a pathological condition. The DNAs preventing and untibodies raised against the antigens useful for treating, preventing and/ or prognosing disorders related to the endocrine system or hormone imbalance or reproductive disorders, cancers of endocrine

WPI; 2001-343950/36. P-PSDB; AAU03538. Nucleic acids encoding human kinase polypeptides, useful for preventing

diagnosing and/or treating e.g. cancer, immune, cardiovascular and neuronal-associated diseases, and microbial infections -

Example 1; Figure 1; 433pp; English.

AASO6701-AASO6757 encode for novel human protein kinases #1-57. The

novel protein kinases have been identified as members of the tyrosine

or setine/throsine kinase (PTK and STX) families. The polymucleotides

or setine/throsine kinase polymeptides may be used in the

provention, diagnosis and treatment of diseases associated with

inappropriate kinase expression. For example, they may be used to treat

cancers (especially cancers of haematopoletic origin), cardiovascular

cancers (especially cancers of haematopoletic origin), cardiovascular

cancers (especially cancers of haematopoletic origin), neurological

cimenum related diseases (e.g. theumatorid arthritis), neurological

discaders (e.g. achizophrenia), neurodegenerative disorders (e.g.

discase (e.g. HIV) and reproductive disorders (e.g. infertility).

Additionally, polymucleotides encoding protein kinases may be

used for gene therapy and as DNA probes in diagnostic assays.

The protein kinase polypeptides may be used as antigens in the production

of antibodies against the protein kinases and in assays to identify

modulators of protein kinase expression and activity.

New human kinase polypeptide, useful in diagnosis, prevention and treatment of cancer, immune disorder, growth and developmental disorder, cardiovascular disorder and lipid disorder

Claim 5; Page 187-188; 196pp; English.

The present invention relates to an isolated human kinase polypeptide (PKIN) or a biologically active/immunogenic fragment of PKIN. FXIN is useful for diagnosing, treating and preventing cancer (e.g., PKIN) is useful for diagnosing, treating and preventing cancer (e.g., PkIN) we land an immunod disorder (e.g., arquired immunodeficiency syndrome (AIDS), Addison's disease, allergy, anaemia, asthma, Crohn's cardiovascular disorder (e.g., atherosts), shing's syndrome, a cardiovascular disorder (e.g., atherosclerosis, hypertension, myocardial infarction), and a lipid disorder (e.g., fatty liver, cholestasis, cardiovascular disorder (e.g., atherosclerosis, hypertension, myocardial infarction), and a lipid disorder (e.g., fatty liver, cholestasis, cardiovascular disorder (e.g., atherosclerosis, hypertension, myocardial infarction), and a lipid disorder (e.g., fatty liver, cholestasis, confarction), and a lipid disorder (e.g., fatty liver, cholestasis, confarction), and a lipid disorder (e.g., fatty liver, cholestasis, confarction), and a lipid disorder (e.g., fatty liver, cholestasis, confarction), and a lipid disorder (e.g., fatty liver, cholestasis, confarction), and a lipid disorder (e.g., fatty liver, cholestasis), confarction disormal disormal disorder, in southern or northern analysis, dot blot or other membrane-based cor mapping naturally occurring genomic sequences. PKIN is useful cor tissues from patients to detect altered PKIN expression. The correspond inmunosorbent (ELISA)-like assays and in microarrays utilising the corresponder of the patients to detect altered PKIN expression. The present sequence is human PKIN-15 cDNA.

The method comprises contacting a biological sample from the patient with prostate cancer-associated polymucleotides (designated PC genes) that selectively pypridise to a sequence that is at least 80% identical to them. The prostate cancer-associated polymucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer, as well as for useful for diagnosing or treating prostate cancer, as well as for identifying modulators of prostate cancer or agents that inhibit prostate cancer. The nucleic acid sequences are particularly useful in gene therapy, as a vaccine or in antisense applications.                                                                                                                                                                                                                                                                                                                                                                      A novel, attenuated HIV-1 genome, HIV-1 CpG1 (AAT14180), is hypersubstituted with noninformational or 'silent' CpG segments. Addition of the CpGs to the genome does not alter the amino acid sequence of the encoded proteins but makes the synthetic genome a target for host cell-methylases. Thus, although the virus for which this genome codes is capable of infecting a cell, the proviral genome is easily inactivated by methylation and kept permanently in a dormant state. The virus can be used for the prepn. of live virus vaccine or to raise diagnostic antibodies.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequence. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell developmental biology; cell signalling; insecticide; Drosophila melanogaster genomic polynucleotide SEQ ID NO 37456. The sequence represents the novel polymucleotide of the invention encoding a polypeptide having haloperoxidase activity, isolated from Phaeotrichoconis cotelariae. The haloperoxidase of the invention works as an enzyme or by oxidation of halide ions, having bactericidal activity. The nucleotide sequence is useful for DNA shuffling (recombination) such that new polymucleotide sequences obtained may encode new polypeptides having haloperoxidase activity with improved properties. The invention relates to methods for killing or inhibiting the growth of microbial cells. The haloperoxidase of the invention may be added to become a component of a detergent composition. The compositions may also comprise one or more other enzymes such as a protease, a lipase,

                                                                                                                                                                                           The sequence represents the coding sequence for the novel polypeptide of the invention having haloperoxidase activity. The polypeptide of the invention also has antibacterial activity. The haloperoxidase is used to kill or inhibit growth of microbial cells. It may be used to preserve or disinfect, for example in water based paints or personal care products, for cleaning surfaces and cooking utensils in food processing plants and any area where food is prepared or served. It may also be used in enzymatic bleaching applications, for example pulp or stain bleaching.
New haloperoxidase purified from Phaeotrichoconis crotalariae has bactericidal activity and is useful as a preservative or disinfectant, for example in body care products and food preparation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1193 GCCACGCGACCTTTGGCGG------

Vockley J; Yamaga S, Weissman SM, 03-OCT-2000; 2000US-237189P (GENE-) GENE LOGIC INC. WPI; 2002-435328/46 Beazer-Barclay Y, 

Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity

Claim 1, SEQ ID No 1201; 114pp; English.

The invention relates to detecting (M1) granulocyte (GC) activation (CCA), by defecting the level of expression of gene (s) (GS) identified by DNA chips analysis as given in the specification, and comparing the expression level in an unactivated (CC where differential expression of GS is indicative of GCA.

Also included are modulating (M2) GA by contacting GC with an agent capable of modulating GA or an inflammation (especially for an allessue, an allesty esponse in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the chronic in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the cheek of expression in a sample of the tissue of gene (s) from GS, where the level of expression of the gene is indicative of inflammation, the level of expression of the gene is indicative of inflammation, and a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by contacting a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by contacting a tissue having inflammation with an agent that modulates the expression of gene (s) conflammation with an agent that modulates the expression of gene (s) inflammatory disease (ed.) perceived of inflammatory disease (ed.) generally chronic) in a tissue, an allergic response in a subject to a pathogen or sterile cresponse in a subject to a pathogen or sterile cresponse in a subject, exposure of a subject to a pathogen or sterile cresponse in a subject, exposure of a subject to a pathogen or sterile cresponse in a subject, exposure of a subject to a pathogen or respectively on inflammation (especially chronic) in a tissue, and inflammatory bowel disease (ed.) perceived disease, also bacterial infection, vincative or the printed specification, procozed inferential inf

Diagnosing and detecting the progression of liver cancer, hepatcocallular carcinoma or metastatic liver tumor in a patient, involves detecting the level of expression of two or more genes in liver tissue sample

Claim 1; SEQ ID NO 3774; 298pp; English.

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatocropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug efficacy and drug metabolism.

Once: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO. It fip. wipp.int/pub/published_pot_sequences.

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL6164 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, descondarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      31 ArgValLysSerSerGluArgLeuAlaMet-LeuArgAlaLeuAlaGlyMetCysGlyHi

```
The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in Abiofo664 to Abbroald), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical solutions as color, breast, stomach, lung, thyroid, cosophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              476

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions Drosophila, developmental biology, cell signalling, insecticide, pharmaceutical, gene; ds. Claim 1, SEQ ID NO 31519; 21pp + Sequence Listing; English. Myers EW, Li PWD, 23-MAR-2000; 2000US-191637P. 23-MAR-2001; 2001WO-US09231 Drosophila melanogaster. Adams M, WPI; 2001-656860/75. (PEKE ) PE CORP NY. WO200171042-A2 27-SEP-2001 Venter JC, 

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention i useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL1011), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Determining the degree of cytosine methylation in genomic DNA, for diagnosis and prognosis, comprises selective hybridization amplicons from chemically treated DNA -

Claim 12; 56pp + Sequence Listing; 56pp; German.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognessis of side effects of the reapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the charm of the determining the degree of cytosine methylation described in the disclosure of the invention

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERENCE: 107196.1136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
                                                     APPLICANT: Marc J. Rubenfield et al.

JILLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: NOTHER PROPERTIONS
FILE REFERENCE: 107196.136
CURRENT PEPPLICATION NUMBER: US/09/252,991A
PRIOR PELING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR PILING DATE: 1999-02-18
PRIOR FILING DATE: 1999-07-18
PRIOR FILING DATE: 1999-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 6770
LENGTH: 1530
